

WHAT IS CLAIMED IS:

1. An ultrasonic clamp coagulator apparatus comprising:
a housing;
5 an ultrasonic waveguide positioned within said housing, said ultrasonic waveguide having an end-effector extending distally from said housing;
a clamp arm pivotally mounted on said housing, said clamp arm pivotable with respect to said end-effector for clamping tissue between said clamp arm and said end-effector, said clamp arm comprising:
10 a top surface, said top surface comprising at least one hole;
a bottom surface opposite said top surface, said bottom surface comprising at least one engaging surface;
wherein said hole extends from said top surface to said engaging surface of said bottom surface; and
15 an actuating element within said housing, said actuating element connected to said clamp arm, said actuating element adapted to actuate said clamp arm pivotably with respect to said end-effector.
2. An ultrasonic clamp coagulator apparatus in accordance with Claim 1, said
20 clamp arm further comprising:
a slot extending from the proximal end of said clamp arm distally into said clamp arm, wherein said slot is straight from said proximal end of said clamp arm to said hole.
- 25 3. An ultrasonic clamp coagulator apparatus in accordance with Claim 2, wherein said clamp arm is curved from the distal end of said slot to the distal end of said clamp arm.

4. An ultrasonic clamp coagulator apparatus comprising:
a housing;
an ultrasonic waveguide positioned within said housing, said ultrasonic
waveguide having an end-effector extending distally from said housing;
5 a clamp arm pivotally mounted on said housing, said clamp arm pivotable with
respect to said end-effector for clamping tissue between said clamp arm and said
end-effector, said clamp arm comprising:
a top surface, said top surface comprising a plurality of holes;
a bottom surface opposite said top surface, said bottom surface
10 comprising a plurality of engaging surfaces;
wherein said plurality of holes extend from said top surface to said plurality
of engaging surfaces of said bottom surface; and
an actuating element within said housing, said actuating element connected to said
clamp arm, said actuating element adapted to actuate said clamp arm pivotably
15 with respect to said end-effector.
5. An ultrasonic clamp coagulator apparatus in accordance with Claim 4, said
clamp arm further comprising:
a slot extending from the proximal end of said clamp arm distally into said clamp
20 arm, wherein said slot is straight from said proximal end of said clamp arm to the
most proximal of said plurality of holes.
6. An ultrasonic clamp coagulator apparatus in accordance with Claim 5,
wherein said clamp arm is curved from the distal end of said slot to the distal end
25 of said clamp arm.
7. An ultrasonic clamp coagulator apparatus in accordance with Claim 6,
wherein said slot is substantially T-shaped.

8. An ultrasonic clamp coagulator apparatus comprising:
a housing;
an ultrasonic waveguide positioned within said housing, said ultrasonic
waveguide having an end-effector extending distally from said housing;
5 a clamp means for clamping tissue between said clamp arm and said end-effector;
and
an actuator connected to said clamp means, said actuator adapted to move said
clamp means with respect to said end-effector.
- 10 9. An ultrasonic clamp coagulator apparatus comprising:
a housing;
an outer tube having a proximal end joined to said housing, and
a distal end, said outer tube defining a longitudinal axis;
an inner tube reciprocally positioned within said outer tube;
15 an ultrasonic waveguide positioned within said outer tube, said ultrasonic
waveguide having an end-effector extending distally of said distal end of
said outer tube, and
a clamp arm pivotally mounted on said distal end of said outer tube for pivotal
movement with respect to said end-effector for clamping tissue between said clamp
20 arm and said end-effector, said clamp arm operatively connected to said inner tube
so that reciprocal movement of said inner tube pivots said clamp arm, said clamp
arm comprising:
a top surface, said top surface comprising at least one hole;
a bottom surface opposite said top surface, said bottom surface comprising
25 at least one engaging surface;
wherein said hole extends from said top surface to said engaging surface of
said bottom surface.
